

Protect your business by protecting your customers.

Here's a scary fact: one pair of flies can easily produce more than 1 million offspring in as little as 6 weeks.

The link between flies and disease is well known. Flies can transmit a range of dangerous disease-causing organisms and carry more than 33 million micro-organisms in their gut!

Flies contaminate food through their saliva, excreta and the hairs on their body. Diseases most commonly spread by flies include:

- Amoebic Dysentery;
- Cholera;
- Gastroenteritis;
- Parasitic Worms;
- Paratyphoid;
- Poliomyelitis;
- Salmonella;
- Shigellosis;
- Trachoma;
- Tuberculosis; and
- Typhoid.
